Badak Jawa or Javan Rhino (Rhinoceros sondaicus) is considered to be one of the world's rarest and most endangered of all mammals. Once it ranged over Bengal through Burma, Sumatra and Java but now only two populations remain. Up to 15 rhinos live along the Dong Nai River in Vietnam and 55 to 60 are left in Ujung Kulon National Park, their last home in Indonesia.

Badak Sumatera or Sumatran Rhino (Dicerorhinus sumatrensis) is the only hairy and smallest of five existing species of rhinoceros. Today, they are found only in small scattered populations living in rugged terrain in Sumatra. Its population is about 500 to 900 animals.

THE POLAR BEAR
The world's largest land carnivore

Benham Folkestone, Kent

One in four of the world's mammals is threatened with extinction in the near future. Human activities – the land we use, the things we buy and the waste we produce – all contribute to species loss. WWF works with governments, international organisations, businesses and local communities to protect the world's ecosystems and endangered species. These include the Siberian tiger, African elephant, Amur leopard, red panda, African wild dog and the rhinoceros – all of which are on the IUCN Red List of Threatened Species.

(Background image) New data, released by the Catlin Arctic Survey and WWF, provides further evidence of thinning Arctic sea ice. This supports the emerging thinking that the Arctic Ocean will be largely ice-free in summer within a decade.

(Stamp pane) The WWF logo was developed by Peter Scott from sketches of Chi-Chi the giant panda by Gerald Watterson.
